Paper 4 Practical

October/November 2025**MARK SCHEME**Maximum Mark: 75

Published

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

Cambridge International will not enter into discussions about these mark schemes.

Cambridge International is publishing the mark schemes for the October/November 2025 series for most Cambridge IGCSE, Cambridge International A and AS Level components, and some Cambridge O Level components.

This document consists of **36** printed pages.

PUBLISHED**Generic Marking Principles**

These general marking principles must be applied by all examiners when marking candidate answers. They should be applied alongside the specific content of the mark scheme or generic level descriptions for a question. Each question paper and mark scheme will also comply with these marking principles.

GENERIC MARKING PRINCIPLE 1:

Marks must be awarded in line with:

- the specific content of the mark scheme or the generic level descriptors for the question
- the specific skills defined in the mark scheme or in the generic level descriptors for the question
- the standard of response required by a candidate as exemplified by the standardisation scripts.

GENERIC MARKING PRINCIPLE 2:

Marks awarded are always **whole marks** (not half marks, or other fractions).

GENERIC MARKING PRINCIPLE 3:

Marks must be awarded **positively**:

- marks are awarded for correct/valid answers, as defined in the mark scheme. However, credit is given for valid answers which go beyond the scope of the syllabus and mark scheme, referring to your Team Leader as appropriate
- marks are awarded when candidates clearly demonstrate what they know and can do
- marks are not deducted for errors
- marks are not deducted for omissions
- answers should only be judged on the quality of spelling, punctuation and grammar when these features are specifically assessed by the question as indicated by the mark scheme. The meaning, however, should be unambiguous.

GENERIC MARKING PRINCIPLE 4:

Rules must be applied consistently, e.g. in situations where candidates have not followed instructions or in the application of generic level descriptors.

PUBLISHED**GENERIC MARKING PRINCIPLE 5:**

Marks should be awarded using the full range of marks defined in the mark scheme for the question (however; the use of the full mark range may be limited according to the quality of the candidate responses seen).

GENERIC MARKING PRINCIPLE 6:

Marks awarded are based solely on the requirements as defined in the mark scheme. Marks should not be awarded with grade thresholds or grade descriptors in mind.

Annotations guidance for centres

Examiners use a system of annotations as a shorthand for communicating their marking decisions to one another. Examiners are trained during the standardisation process on how and when to use annotations. The purpose of annotations is to inform the standardisation and monitoring processes and guide the supervising examiners when they are checking the work of examiners within their team. The meaning of annotations and how they are used is specific to each component and is understood by all examiners who mark the component.

We publish annotations in our mark schemes to help centres understand the annotations they may see on copies of scripts. Note that there may not be a direct correlation between the number of annotations on a script and the mark awarded. Similarly, the use of an annotation may not be an indication of the quality of the response.

The annotations listed below were available to examiners marking this component in this series.

Annotations

Annotation	Meaning
	Benefit of the doubt
	To indicate where a key word/phrase/code is missing
	Incorrect
	Follow through
	Indicate a point in an answer
Highlighted text	To draw attention to a particular aspect or to indicate where parts of an answer have been combined
	Ignore
	Not answered question
	No benefit of doubt given
	No examples or not enough

PUBLISHED

Annotation	Meaning
	Not relevant or used to separate parts of an answer
Off-page comment	Allows comments to be entered at the bottom of the RM marking window and then displayed when the associated question item is navigated to.
	Repetition
	Indicates that work or a page has been seen including blank answer spaces and blank pages.
	Correct
	Too vague

Mark scheme abbreviations

- **Bold** in mark scheme means that idea is required.
- / in mark scheme means alternative.
- // in mark scheme means alternative solution that gains the same mark point.
- ... at the end of one mark point without a ... at the start of the next just means the sentence follows on. There is no dependency.
- ... at the end of one mark point and ... at the start of the next, this means the second cannot be awarded without the first.
- () means what is in the brackets is not required, or it is not required in some languages but may be required in others.

PUBLISHED

Question	Answer	Marks
1(a)	1 mark each • (Global) 1D array initialised with 30 null values • (Global) <code>TopofStack</code> initialised with <code>-1</code> Example program code Java <pre>public static Integer[] Stack = new Integer[30]; public static Integer TopOfStack; public static void main(String args[]){ for(Integer X = 0; X < 30; X++){ Stack[X] = null; } TopOfStack = -1; }</pre> VB.NET <pre>Dim Stack(29) As Integer Dim TopOfStack As Integer Sub Main(args As String()) For x = 0 To 29 Stack(x) = Nothing Next TopOfStack = -1 End Sub</pre> Python <pre>Stack = [None for x in range(30)] TopOfStack = -1</pre>	2

Question	Answer	Marks
1(b)	1 mark each - Function header (and end) taking one parameter, returning Boolean in all instances - Checking if stack is full (<code>TopOfStack = 29</code>) and, if it is, returning <code>FALSE</code> - Incrementing <code>TopOfStack</code> (Otherwise) Storing parameter in incremented <code>TopOfStack</code> position and returning <code>TRUE</code> Example program code Java <pre>public static Boolean Push(Integer DataToPush){ if(TopOfStack < 29){ TopOfStack++; Stack[TopOfStack] = DataToPush; return true; } return false; }</pre> VB.NET <pre>Function Push(DataToPush) If TopOfStack < 29 Then TopOfStack = TopOfStack + 1 Stack(TopOfStack) = DataToPush Return True End If Return False End Function</pre>	4

Question	Answer	Marks
1(b)	<pre>Python def Push(DataToPush): global Stack global TopOfStack if TopOfStack < 29: TopOfStack = TopOfStack + 1 Stack[TopOfStack] = DataToPush return True else: return False</pre>	

PUBLISHED

Question	Answer	Marks
1(c)	1 mark each • Function header (and end) returning integer in all cases • Checking if stack empty (<code>TopofStack = -1</code>) and returning <code>-999</code> when true • (Otherwise) Accessing and returning item at <code>TopOfStack</code> (before it's decremented) • Decrementing <code>TopofStack</code> Example program code Java <pre>public static Integer Pop(){ Integer DataReturn; if(TopOfStack == -1){ return -999; } DataReturn = Stack[TopOfStack]; TopOfStack--; return DataReturn; }</pre> VB.NET <pre>Function Pop() If TopOfStack = -1 Then Return -999 Else Dim DataReturn As Integer = Stack(TopOfStack) TopOfStack = TopOfStack - 1 Return DataReturn End If End Function</pre>	4

Question	Answer	Marks
1(c)	<pre>Python def Pop(): global Stack global TopOfStack if TopOfStack == -1: return -999 else: DataReturn = Stack[TopOfStack] TopOfStack = TopOfStack - 1 return DataReturn</pre>	

PUBLISHED

Question	Answer	Marks
1(d)	1 mark each • Looping 40 times • Generating random number between 0 and 1000 inclusive inside the loop • Calling <code>Push()</code> with each random number and storing/using return value ... if return value is <code>FALSE</code> output <code>Stack full</code> and breaking out of loop Example program code Java <pre>for(Integer X = 0; X < 40; X++){ Pushed = Push(RandomNumber.nextInt(1001)); if(Pushed == false){ System.out.println("Stack full"); X = 40; } }</pre> VB.NET <pre>For x = 0 To 39 Pushed = Push(RandomNumber.Next(0, 1000)) If Pushed = False Then Console.WriteLine("Stack full") x = 40 End If Next</pre> Python <pre>for x in range(40): Pushed = Push(random.randint(0,1000)) if Pushed == False: print("Stack full") break</pre>	4

PUBLISHED

Question	Answer	Marks
1(e)	1 mark each • Procedure header (and end) and output of highest and lowest include appropriate messages • Calls <code>Pop()</code> until there are no items left in stack (<code>return value = -999 // TopOfStack = -1</code>) and storing/using return values • Finds and outputs highest value from returned values • Finds and outputs lowest value from returned values Example program code Java <pre>public static void FindValues(){ Integer Highest; Integer Lowest; Highest = Pop(); Lowest = Highest; Integer ReturnValue = Highest; while(ReturnValue != -999){ if(ReturnValue > Highest){ Highest = ReturnValue; } if(ReturnValue < Lowest){ Lowest = ReturnValue; } ReturnValue = Pop(); } System.out.println("The highest value is " + Highest + " and the lowest value is " + Lowest); }</pre>	4

Question	Answer	Marks
1(e)	VB.NET <pre> Sub FindValues() Dim Highest, Lowest As Integer Highest = Pop() Lowest = Highest Dim ReturnValue As Integer = Highest While ReturnValue <> -999 If ReturnValue > Highest Then Highest = ReturnValue End If If ReturnValue < Lowest Then Lowest = ReturnValue End If ReturnValue = Pop() End While Console.WriteLine("The highest value is " & Highest & " and the lowest value is " & Lowest) End Sub </pre> Python <pre> def FindValues(): Highest = Pop() Lowest = Highest ReturnValue = Lowest while(ReturnValue != -999): if ReturnValue > Highest: Highest = ReturnValue if ReturnValue < Lowest: Lowest = ReturnValue ReturnValue = Pop() print("The highest value is", Highest, "and the lowest value is", Lowest) </pre>	

PUBLISHED

Question	Answer	Marks
1(f)(i)	1 mark for calling <code>FindValues()</code> Example program code Java <code>FindValues();</code> VB.NET <code>FindValues()</code> Python <code>FindValues()</code>	1
1(f)(ii)	1 mark for a screenshot of output showing Stack full output once Lowest value output in an appropriate message Highest value output in an appropriate message Lowest and Highest must be 0–1000 inclusive	1

PUBLISHED

Question	Answer	Marks
2(a)(i)	1 mark each • Class header (and end) • Declaration of 2 private attributes with correct data types • Constructor header (and end) within class with 2 parameters ... • ... assigning parameters to attributes Example program code Java <pre>class Train{ private String Number; private Integer Route; public Train(String pNumber, Integer pRoute){ Number = pNumber; Route = pRoute; } }</pre> VB.NET <pre>Class Train Private TrainIDNumber As String Private Route As Integer Sub New(pNumber, pRoute) TrainIDNumber = pNumber Route = pRoute End Sub End Class</pre> Python <pre>class Train(): def __init__(self, pNumber, pRoute): self.__TrainIDNumber = pNumber #string self.__Route = pRoute #integer</pre>	4

PUBLISHED

Question	Answer	Marks
2(a)(ii)	1 mark each • One get method header (and end) with no parameter ... • ... returning correct attribute • Second correct get method Example program code Java <pre>public String GetTrainNumber(){ return Number; } public Integer GetRoute(){ return Route; }</pre> VB.NET <pre>Function GetTrainIDNumber() Return TrainIDNumber End Function Function GetRoute() Return Route End Function</pre> Python <pre>def GetTrainIDNumber(self): return self.__TrainIDNumber def GetRoute(self): return self.__Route</pre>	3

PUBLISHED

Question	Answer	Marks
2(b)	1 mark each • One instance of train with correct arguments and stored in a variable/structure • Remaining three instances correct Example program code Java <pre>Train FirstTrain = new Train("12ADV", 134); Train SecondTrain = new Train("33ART", 20); Train ThirdTrain = new Train("9FKF", 3); Train FourthTrain = new Train("21VBC", 24)</pre> VB.NET <pre>Dim FirstTrain As Train = New Train("12ADV", 134) Dim SecondTrain As Train = New Train("33ART", 20) Dim ThirdTrain As Train = New Train("9FKF", 3) Dim FourthTrain As Train = New Train("21VBC", 24)</pre> Python <pre>FirstTrain = Train("12ADV",134) SecondTrain = Train("33ART",20) ThirdTrain = Train("9FKF",3) FourthTrain = Train("21VBC",24)</pre>	2

PUBLISHED

Question	Answer	Marks
2(c)(i)	1 mark each • Class header (and end) with four private attributes with appropriate data types • Constructor header (and end) within class taking 2 parameters ... • ... assigning parameters to attributes, initialising <code>NumberTrains</code> to 0, initialising <code>Trains</code> to an empty array Example program code Java <pre>class Station{ private String StationID; private Integer NumberPlatforms; private Train[] Trains = new Train[10]; private Integer NumberTrains; public Station(String pID, Integer pNumberOfPlatforms){ StationID = pID; NumberPlatforms = pNumberOfPlatforms; NumberTrains = 0; } }</pre> VB.NET <pre>Class Station Private StationID As String Private NumberPlatforms As Integer Private Trains(9) As Train Private NumberTrains As Integer Sub New(pID, pNumberOfPlatforms) StationID = pID NumberPlatforms = pNumberOfPlatforms NumberTrains = 0 End Sub End Class</pre>	3

Question	Answer	Marks
2(c)(i)	<pre>Python class Station(): def __init__(self, pID, pNumberOfPlatforms): self.__StationID = pID #string self.__NumberPlatforms = pNumberOfPlatforms #integer self.__Trains = [] #train 10 elements self.__NumberTrains = 0 #integer</pre>	

Question	Answer	Marks
2(c)(ii)	1 mark each • Method header (and close) taking one <code>Train</code> parameter • Checking if all platforms are full and returning <code>FALSE</code> • (Otherwise) Storing parameter in array <code>Trains</code> ... • ... incrementing <code>NumberTrains</code> and returning <code>True</code> Example program code Java <pre>public Boolean AddTrain(Train NewTrain){ if(NumberTrains >= NumberPlatforms){ return false; } Trains[NumberTrains] = NewTrain; NumberTrains++; return true; }</pre> VB.NET <pre>Function AddTrain(NewTrain) If NumberTrains >= NumberPlatforms Then Return False End If Trains(NumberTrains) = NewTrain NumberTrains = NumberTrains + 1 Return True End Function</pre> Python <pre>def AddTrain(self, NewTrain): if self.__NumberTrains >= self.__NumberPlatforms: return False else: self.__Trains.append(NewTrain) self.__NumberTrains += 1 return True</pre>	4

PUBLISHED

Question	Answer	Marks
2(c)(iii)	1 mark each • Method header (and close) and returning a string in all cases • Checking if no trains and returning "There are no trains" • (Otherwise) Looping through each train in the station ... • ... accessing train ID number and route number using get methods • ... creating a string with ID number and route number for each train • ... returning correctly formatted string Example program code Java <pre>public String GetTrains() { if (NumberTrains == 0) { return "There are no trains"; } String OutputLine = "The trains at station " + StationID + " are: \n"; for (Integer x = 0; x < NumberTrains; x++) { OutputLine = OutputLine + Trains[x].GetTrainNumber() + " on route number " + Trains[x].GetRoute() + "\n"; } return OutputLine; }</pre> VB.NET <pre>Function GetTrains() If NumberTrains = 0 Then Return "There are no trains" End If Dim OutputLine As String = "The trains at station " & StationID & " are:" & vbNewLine For x = 0 To NumberTrains - 1 OutputLine = OutputLine & Trains(x).GetTrainIDNumber() & " on route number " & Trains(x).GetRoute() & vbNewLine Next Return OutputLine End Function</pre>	6

PUBLISHED

Question	Answer	Marks
2(c)(iii)	Python <pre>def GetTrains(self): if self.__NumberTrains == 0: return "There are no trains" OutputLine = "The trains at station " + self.__StationID + " are: \n" for x in range(self.__NumberTrains): OutputLine = OutputLine + self.__Trains[x].GetTrainIDNumber() + " on route number " + str(self.__Trains[x].GetRoute()) + "\n" return OutputLine</pre>	
2(d)(i)	1 mark each • One instance of <code>Station</code> created with correct arguments and stored • Second correct instance and stored Example program code Java <pre>Station SouthStation = new Station("STH", 2); Station NorthStation = new Station("NTH", 1);</pre> VB.NET <pre>Dim SouthStation As Station = New Station("STH", 2) Dim NorthStation As Station = New Station("NTH", 1)</pre> Python <pre>SouthStation = Station("STH",2) NorthStation = Station("NTH",1)</pre>	2

Question	Answer	Marks
2(d)(ii)	1 mark each • Calling AddTrain for 3 correct trains for station STH once • Calling AddTrain for 1 correct train for station NTH once • Outputting "Station is full" if any return value is FALSE • Calling GetTrains() for both stations and outputting return values Example program code Java <pre>Boolean ReturnValue = SouthStation.AddTrain(FirstTrain); if(ReturnValue == false) { System.out.println("Station is full"); } ReturnValue = SouthStation.AddTrain(SecondTrain); if(ReturnValue == false) { System.out.println("Station is full"); } ReturnValue = SouthStation.AddTrain(ThirdTrain); if(ReturnValue == false) { System.out.println("Station is full"); } ReturnValue = NorthStation.AddTrain(FourthTrain); if(ReturnValue == false) { System.out.println("Station is full"); } System.out.println(SouthStation.GetTrains()); System.out.println(NorthStation.GetTrains());</pre> VB.NET <pre>Dim ReturnValue As Boolean = SouthStation.AddTrain(FirstTrain) If ReturnValue = False Then Console.WriteLine("Station is full") End If ReturnValue = SouthStation.AddTrain(SecondTrain) If ReturnValue = False Then</pre>	4

PUBLISHED

Question	Answer	Marks
2(d)(ii)	<pre> Console.WriteLine("Station is full") End If ReturnValue = SouthStation.AddTrain(ThirdTrain) If ReturnValue = False Then Console.WriteLine("Station is full") End If ReturnValue = NorthStation.AddTrain(FourthTrain) If ReturnValue = False Then Console.WriteLine("Station is full") End If Console.WriteLine(SouthStation.GetTrains()) Console.WriteLine(NorthStation.GetTrains()) Python ReturnValue = SouthStation.AddTrain(FirstTrain) if ReturnValue == False: print("Station is full") ReturnValue = SouthStation.AddTrain(SecondTrain) if ReturnValue == False: print("Station is full") ReturnValue = SouthStation.AddTrain(ThirdTrain) if ReturnValue == False: print("Station is full") ReturnValue = NorthStation.AddTrain(FourthTrain) if ReturnValue == False: print("Station is full") print(SouthStation.GetTrains()) print(NorthStation.GetTrains()) </pre>	

Question	Answer	Marks
2(d)(iii)	1 mark each, screenshot(s) showing: • One output of "Station is full" • Output of correct data for both stations (in correct format) e.g. <pre>Station is full The trains at station STH are: 12ADV on route number 134 33ART on route number 20 The trains at station NTH are: 21VBC on route number 24</pre>	2

PUBLISHED

Question	Answer	Marks
3(a)	1 mark each • Class header (and end) and constructor header (and end) in class • Constructor takes two parameters and stores each in attributes Example program code Java <pre>class Record{ public Integer Key; public String Data; public Record(Integer pKey, String pData){ Key = pKey; Data = pData; } }</pre> VB.NET <pre>Class Record Dim Key As Integer Dim Data As String Sub New(pKey, pData) Key = pKey Data = pData End Sub End Class</pre> Python <pre>class Record: def __init__(self, pKey, pData): self.Key = pKey #integer self.Data = pData #string</pre>	2

Question	Answer	Marks
3(b)	1 mark each 2D array of 100×10 elements of type <code>Record</code> - Procedure <code>InitialiseHashTable()</code> header (and end) and initialises each element in the 2D array to an empty/null record in procedure Example program code Java <pre>public static Record[][] HashTable = new Record[100][10]; public static void InitialiseHashTable(){ Record EmptyRecord = new Record(-1, "-1"); for(Integer X = 0; X < 100; X++){ for(Integer Y = 0; Y < 10; Y++){ HashTable[X][Y] = EmptyRecord; } } }</pre> VB.NET <pre>Dim HashTable(99, 9) As Record Sub InitialiseHashTable() Dim EmptyRecord As Record = New Record(-1, "") For X = 0 To 99 For Y = 0 To 9 HashTable(X, Y) = EmptyRecord Next Next End Sub</pre> Python <pre>HashTable = [] def InitialiseHashTable(): global HashTable HashTable = [[Record(-1, "")]*10 for i in range(100)]</pre>	2

Question	Answer	Marks
3(c)	1 mark each • Function header (and end) taking one parameter and returning calculated hash • hash calculated correctly from parameter Example program code Java <pre>public static Integer Hash(Integer TheKey){ return(TheKey % 100); }</pre> VB.NET <pre>Function Hash(Key) Return Key Mod 100 End Function</pre> Python <pre>def Hash(Key): return Key % 100</pre>	2

Question	Answer	Marks
3(d)	1 mark each • Procedure header (and end) taking one <code>Record</code> parameter • Calling <code>Hash()</code> using key from parameter and storing/using return value • Accessing <code>HashTable[return][0]</code> and storing parameter if no collision if collision: iterating through 2nd dimension to find empty index and store parameter in that position Example program code Java <pre>public static void InsertData (Record RecordData) { Integer HashValue = Hash(RecordData.Key); for(Integer X = 0; X < 10; X++){ if(HashTable[HashValue][X].Key.equals(-1)){ HashTable[HashValue][X] = RecordData; X = 10; } } }</pre> VB.NET <pre>Function InsertData (RecordData) Dim HashValue As Integer = Hash(RecordData.Key) For X = 0 To 9 If HashTable(HashValue, X).Key = -1 Then HashTable(HashValue, X) = RecordData X= 10 End If Next X End Function</pre>	4

Question	Answer	Marks
3(d)	<pre>Python def InsertData(RecordData): global HashTable HashValue = Hash(RecordData.Key) for X in range(0, 10): if HashTable[HashValue][X].Key == -1: HashTable[HashValue][X] = RecordData</pre>	

Question	Answer	Marks
3(e)	1 mark each to max 5 • Procedure header (and end), opening file and closing file (in appropriate place) • Iterating through each line in file // reading each line in from file • Splitting each line read in by comma ... • ... creating <code>Record</code> object with each key and data as arguments ... • ... calling <code>InsertData()</code> with each object • Try, catch with appropriate output and all file access within try Example program code Java <pre> public static void ReadData() { String[] Data = new String[3]; Integer NewKey; IntegerNewItem1; IntegerNewItem2; Record TheRecord; try{ FileReader File = new FileReader("HashTableData.txt"); try{ BufferedReader Reader = new BufferedReader(File); String Line= Reader.readLine(); while (Line != null){ Line = Line.replace("\n", ""); Data = Line.split(","); TheRecord = new Record(Integer.parseInt(Data[0]), Data[1]); InsertData(TheRecord); Line= Reader.readLine(); } Reader.close(); }catch(IOException ex){} }catch(FileNotFoundException e){System.out.println("File not found");} } </pre>	5

PUBLISHED

Question	Answer	Marks
3(e)	VB.NET <pre> Sub ReadData() Dim Line As String Dim Data(3) As String Dim TheRecord As Record Dim FileReader As New System.IO.StreamReader("HashTableData.txt") While Not FileReader.EndOfStream Line = FileReader.ReadLine() Data = Split(Line, ",") TheRecord = New Record(Integer.Parse(Data(0)), Data(1)) InsertData(TheRecord) End While FileReader.Close() End Sub </pre> Python <pre> def ReadData(): global HashTable File = open("HashTableData.txt") for Line in File: Data = Line.strip() Data = Line.split(",") InsertData(Record(int(Data[0]), Data[1])) File.close() </pre>	

PUBLISHED

Question	Answer	Marks
3(f)	1 mark each • Function header (and end) taking one parameter and returning string in all cases • Calling <code>Hash()</code> with parameter and storing/using return value • Iterating through 2nd dimension at <code>HashTable[return value]</code> and comparison to parameter ... • ... returning data if found/equal • ... returning "Not found" if not found by the end of the dimension Example program code Java <pre>public static String GetRecord(Integer Key){ Integer HashValue = Hash(Key); for(Integer X = 0; X < 10; X++){ if(HashTable[HashValue][X].Key.equals(Key)){ return(HashTable[HashValue][X].Data); } } return "Not found"; }</pre> VB.NET <pre>Function GetRecord(Key) Dim HashValue As Integer = Hash(Key) For X = 0 To 9 If HashTable(HashValue, X).Key = Key Then Return HashTable(HashValue, X).Data End If Next X Return "Not found" End Function</pre>	5

PUBLISHED

Question	Answer	Marks
3(f)	<pre>Python def GetRecord(Key): global HashTable HashValue = Hash(Key) for X in range(0, 10): if HashTable[HashValue][X].Key == Key: return HashTable[HashValue][X].Data return "Not found"</pre>	

PUBLISHED

Question	Answer	Marks
3(g)(i)	1 mark each • Calling <code>InitialiseHashTable()</code> then <code>ReadData()</code> • Taking five (integer) inputs • Calling <code>GetRecord()</code> with each input and outputting return value Example program code Java <pre>public static void main(String args[]){ InitialiseHashTable(); ReadData(); Scanner scanner = new Scanner(System.in); for(Integer X = 0; X < 5; X++){ System.out.println("Enter key field"); System.out.println(GetRecord(Integer.parseInt(scanner.nextLine()))); } }</pre> VB.NET <pre>Sub Main(args As String()) InitialiseHashTable() ReadData() For X = 0 To 5 Console.WriteLine("Enter key field") Console.WriteLine(GetRecord(Console.ReadLine())) Next End Sub</pre>	3

PUBLISHED

Question	Answer	Marks
3(g)(i)	Python <pre>InitialiseHashTable() ReadData() for x in range(5): Key = int(input("Enter key field ")) print(GetRecord(Key))</pre>	
3(g)(ii)	1 mark each for screenshot(s) showing - Input of the 4 integers and matching word output <pre>528 permission 1128 peace 1828 precedent 1062 up</pre> - Input of 39 and output of Not found e.g.  <pre>Enter key field 528 permission Enter key field 1128 peace Enter key field 1828 precedent Enter key field 1062 up Enter key field 39 Not found</pre>	2
