Paper 3 Advanced Practical Skills 1

May/June 2021

2 hours

You must answer on the question paper.

You will need: The materials and apparatus listed in the confidential instructions

INSTRUCTIONS

- Answer **all** questions.
- Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do **not** use an erasable pen or correction fluid.
- Do **not** write on any bar codes.
- You may use a calculator.
- You should show all your working, use appropriate units and use an appropriate number of significant figures.
- Give details of the practical session and laboratory, where appropriate, in the boxes provided.

INFORMATION

- The total mark for this paper is 40.
- The number of marks for each question or part question is shown in brackets [].
- The Periodic Table is printed in the question paper.
- Notes for use in qualitative analysis are provided in the question paper.

Session

This document has **12** pages. Any blank pages are indicated.

Quantitative analysis

Read through the whole method before starting any practical work. Where appropriate, prepare a table for your results in the space provided.

Show your working and appropriate significant figures in the final answer to **each** step of your calculations.

- 1 In this experiment you will carry out a titration to determine the relative formula mass, M_r , of a monoprotic acid, HX.

FA 1 is HX, the monoprotic acid.

FA 2 is $0.0450 \text{ mol dm}^{-3}$ sodium carbonate, Na_2CO_3 .
methyl orange indicator

(a) Method

Preparing a solution of FA 1

- Weigh the empty 250 cm^3 beaker. Record the mass.
- Transfer all the **FA 1** into the beaker.
- Weigh the beaker and **FA 1**. Record the mass.
- Calculate and record the mass of **FA 1** used.
- Add approximately 100 cm^3 of distilled water to the **FA 1** in the beaker.
- Stir the mixture with a glass rod until all the **FA 1** has dissolved.
- Transfer this solution into the 250 cm^3 volumetric flask.
- Wash the beaker with distilled water and transfer the washings to the volumetric flask.
- Rinse the glass rod with distilled water and transfer the washings to the volumetric flask.
- Make up the solution in the volumetric flask to the mark using distilled water.
- Shake the flask thoroughly.
- This solution of HX is **FA 3**. Label the flask **FA 3**.

Results

Titration

- Fill the burette with **FA 3**.
- Pipette 25.0 cm^3 of **FA 2** into a conical flask.
- Add several drops of methyl orange indicator.
- Perform a rough titration and record your burette readings in the space below.

The rough titre is cm^3 .

- Carry out as many accurate titrations as you think necessary to obtain consistent results.
- Make sure any recorded results show the precision of your practical work.
- Record in a suitable form below all of your burette readings and the volume of **FA 3** added in each accurate titration.

II	
III	
IV	
V	
VI	
VII	
VIII	

[8]

- (b) From your accurate titration results, obtain a suitable value for the volume of **FA 3** to be used in your calculations.
Show clearly how you obtained this value.

25.0 cm³ of **FA 2** required cm³ of **FA 3**. [1]

(c) **Calculations**

- (i) Calculate the number of moles of sodium carbonate present in the volume of **FA 2** used in each titration.

moles of Na₂CO₃ = mol [1]

- (ii) Give the equation for the reaction of **FA 2**, Na₂CO₃, with **FA 3**, HX.

Use your answer to (c)(i) to deduce the number of moles of HX present in the volume you calculated in (b).

moles of HX = mol [1]

- (iii) Use your answer to (c)(ii) and your data recorded on page 2 to calculate the relative formula mass, M_r , of HX.
Show your working.

M_r of HX = [2]

- (iv) One molecule of HX contains one nitrogen atom, three oxygen atoms, three hydrogen atoms and one atom of another element, **E**.
The identity of **E** can be found by calculation.

Show this calculation and identify **E**.

Element **E** is [1]

- (d) What is the error in a single reading for the balance that you used?

error = g

Calculate the maximum percentage error in the mass of **FA 1** that you recorded on page 2.

maximum percentage error = %
[1]

- (e) Suggest and carry out an experiment using aqueous silver nitrate to determine whether the compound AgX is soluble or insoluble in water.

method

.....

observations

conclusion

[2]

- (f) Suggest why the use of methyl orange indicator might give an inaccurate titration result.

.....

..... [1]

[Total: 18]

- 2 You will determine the percentage by mass of water of crystallisation in a hydrated salt by thermal decomposition. When a hydrated salt is heated it loses its water of crystallisation.

FA 4 is the hydrated salt.

(a) Method

- Weigh the crucible with its lid. Record the mass.
- Transfer 2.0–2.2 g of **FA 4** from the container into the crucible.
- Weigh the crucible, lid and **FA 4**. Record the mass.
- Calculate and record the mass of **FA 4** used.
- Place the crucible and contents on the pipe-clay triangle.
- Heat gently, with the lid on, for approximately 1 minute.
- Heat strongly, with the lid off, for a further 4 minutes.
- Replace the lid and leave the crucible to cool for at least 5 minutes.

During the cooling period, you may wish to begin work on Question 3.

- When the crucible is cool, weigh the crucible with its lid and contents. Record the mass.
- Heat strongly, with the lid off, for a further 2 minutes.
- Replace the lid and leave the crucible to cool for at least 5 minutes.
- When it is cool, weigh the crucible with its lid and contents. Record the mass.
- Calculate and record the mass lost.

Keep FA 4 for use in Question 3.

Results

II	
III	
IV	
V	

[5]

- (b) (i)** Calculate the percentage by mass of water of crystallisation in **FA 4**.

percentage by mass of H₂O in **FA 4** = % [1]

- (ii)** State what assumption you made about anhydrous **FA 4** in your calculation in **(b)(i)**.

.....
 [1]

[Total: 7]

Qualitative analysis

Where reagents are selected for use in a test, the **name** or **correct formula** of the element or compound must be given.

At each stage of any test you are to record details of the following:

- colour changes seen
- the formation of any precipitate and its solubility in an excess of the reagent added
- the formation of any gas and its identification by a suitable test.

You should indicate clearly at what stage in a test a change occurs.

If any solution is warmed, a **boiling tube** must be used.

Rinse and reuse test-tubes and boiling tubes where possible.

No additional tests for ions present should be attempted.

- 3 (a) FA 4** contains one cation and one anion both of which are listed in the Qualitative Analysis Notes.

Dissolve the remainder of the **FA 4** in approximately 20 cm³ of water in the 100 cm³ beaker. Use a 1 cm depth of this solution in a test-tube for each of the tests.

- (i)** The anion in **FA 4** is chloride.

State which reagents you would use to identify this ion conclusively.

.....

Use your reagents to test your solution of **FA 4**.
Record your observations.

.....

.....

.....

In what way are your observations **not** consistent with the expected results for chloride?

.....

.....

[3]

- (ii) Add an equal volume of dilute sulfuric acid to aqueous **FA 4**.

Record your observations and deduce the identity of the cation in **FA 4**.

observations

identity of cation

Give the ionic equation for this reaction. Include state symbols.

..... [2]

- (b) Use the conclusions in (a)(i) and (a)(ii) to calculate the relative formula mass of anhydrous **FA 4**.

M_r =

Use your results from **Question 2** to calculate the number of moles of water of crystallisation in one mole of hydrated **FA 4**.

moles of H_2O = [3]

- (c) **FA 5** contains one cation and one anion, both of which are listed in the Qualitative Analysis Notes.

- (i) Heat a small spatula measure of **FA 5** in a hard-glass test-tube.
Keep heating until no further change is observed.
Record **all** your observations.

.....
.....
.....
..... [2]

- (ii) To a 1 cm depth of dilute sulfuric acid in a test-tube, add a small spatula measure of **FA 5**. Record all your observations.

.....
.....
.....
.....
..... [3]

- (iii) Place a small spatula measure of **FA 5** into a boiling tube. Add a 1 cm depth of aqueous sodium hydroxide and warm the mixture gently. Record your observations.

.....
..... [1]

- (iv) From the results of your tests, deduce the chemical formula of **FA 5**.

FA 5 is [1]

[Total: 15]

Qualitative analysis notes

1 Reactions of aqueous cations

ion	reaction with	
	NaOH(aq)	NH ₃ (aq)
aluminium, Al ³⁺ (aq)	white ppt. soluble in excess	white ppt. insoluble in excess
ammonium, NH ₄ ⁺ (aq)	no ppt. ammonia produced on heating	—
barium, Ba ²⁺ (aq)	faint white ppt. is nearly always observed unless reagents are pure	no ppt.
calcium, Ca ²⁺ (aq)	white ppt. with high [Ca ²⁺ (aq)]	no ppt.
chromium(III), Cr ³⁺ (aq)	grey-green ppt. soluble in excess	grey-green ppt. insoluble in excess
copper(II), Cu ²⁺ (aq)	pale blue ppt. insoluble in excess	pale blue ppt. soluble in excess giving dark blue solution
iron(II), Fe ²⁺ (aq)	green ppt. turning brown on contact with air insoluble in excess	green ppt. turning brown on contact with air insoluble in excess
iron(III), Fe ³⁺ (aq)	red-brown ppt. insoluble in excess	red-brown ppt. insoluble in excess
magnesium, Mg ²⁺ (aq)	white ppt. insoluble in excess	white ppt. insoluble in excess
manganese(II), Mn ²⁺ (aq)	off-white ppt. rapidly turning brown on contact with air insoluble in excess	off-white ppt. rapidly turning brown on contact with air insoluble in excess
zinc, Zn ²⁺ (aq)	white ppt. soluble in excess	white ppt. soluble in excess

2 Reactions of anions

<i>ion</i>	<i>reaction</i>
carbonate, CO_3^{2-}	CO_2 liberated by dilute acids
chloride, $\text{Cl}^-(\text{aq})$	gives white ppt. with $\text{Ag}^+(\text{aq})$ (soluble in $\text{NH}_3(\text{aq})$)
bromide, $\text{Br}^-(\text{aq})$	gives cream ppt. with $\text{Ag}^+(\text{aq})$ (partially soluble in $\text{NH}_3(\text{aq})$)
iodide, $\text{I}^-(\text{aq})$	gives yellow ppt. with $\text{Ag}^+(\text{aq})$ (insoluble in $\text{NH}_3(\text{aq})$)
nitrate, $\text{NO}_3^-(\text{aq})$	NH_3 liberated on heating with $\text{OH}^-(\text{aq})$ and Al foil
nitrite, $\text{NO}_2^-(\text{aq})$	NH_3 liberated on heating with $\text{OH}^-(\text{aq})$ and Al foil
sulfate, $\text{SO}_4^{2-}(\text{aq})$	gives white ppt. with $\text{Ba}^{2+}(\text{aq})$ (insoluble in excess dilute strong acids)
sulfite, $\text{SO}_3^{2-}(\text{aq})$	gives white ppt. with $\text{Ba}^{2+}(\text{aq})$ (soluble in excess dilute strong acids)

3 Tests for gases

<i>gas</i>	<i>test and test result</i>
ammonia, NH_3	turns damp red litmus paper blue
carbon dioxide, CO_2	gives a white ppt. with limewater (ppt. dissolves with excess CO_2)
chlorine, Cl_2	bleaches damp litmus paper
hydrogen, H_2	'pops' with a lighted splint
oxygen, O_2	relights a glowing splint
